Transmission Temperature Probe Body

This allows you to read the temperature as it comes from the converter in real time. With this you know the amount of heat your converter is creating. After we installed this and saw the amount of heat generated is when we designed the Start Line Control device to limit the amount of heat we generated on the starting line.

The bottom port on the side of the POWERGLIDE is the port from the converter, as you can see in the photo we have plumbed this to feed in one end and out the side allowing the fluid to flow over the temperature probe to give the most accurate and fastest temperature response time.

Dash 6 SAE O-Ring ports for fluid in and out and a 3/8" NPT thread for the temperature probe adapter. If you don't have a temperature probe adapter to 3/8" NPT you can use a Speedflow PN 660-06

PN 32111-60501
